

Tiny Steps Learning App Summary

What It Is

Tiny Steps Learning is a React and Vite web app for an online English learning program for kids. It combines a public marketing site with role-based portals for parents, teachers, and kids.

Who It Is For

Primary persona: parents or guardians of children ages 3-12 seeking online phonics, grammar, and public speaking classes.

What It Does

- Public marketing site with home, courses, pricing, blog, FAQ, contact, and summer camp pages.
- Course detail pages for phonics, grammar, speaking, plus parent help hub articles.
- Role-based login and routing for admin, teacher, parent, learning partner, and kid portals.
- Parent dashboard with progress insights, weekly reports, games progress, and payments.
- Teacher tools for lesson library, student topic progress, and weekly reports.
- Kids portal with phonics games (sound detective, letter tracing, CVC reader).
- Ask TinySteps assistant and WhatsApp contact entry point.

How It Works (Architecture)

- Frontend: React + Vite app; main.tsx sets QueryClientProvider, Sentry ErrorBoundary, and analytics init.
- Routing/layout: createBrowserRouter with lazy-loaded pages; shared Layout includes Header and FloatingAssistant; RoleGate protects routes.
- Data/services: firebaseConfig.ts initializes Auth, Firestore, and Functions; hooks/services query Firestore and call Cloud Functions (askTinySteps, createPhonePeOrder).
- Observability: Sentry for error reporting; GA tracking limited to public routes.
- Data flow: User -> UI components -> hooks/services -> Firestore/Functions -> UI; analytics -> GA; errors -> Sentry.

How To Run (Minimal)

- Install dependencies (Not found in repo).
- Set Vite env vars for Firebase and Sentry (see .env.example and .env.* files).
- Start dev server: npm run dev (from IMPLEMENTATION_QUICK_START.md).
- Open http://localhost:5173 in a browser.
